Towards the GWAS pipeline: revising the steps

Christian Werner

(Quantitative geneticist and biostatistician) **EiB, CIMMYT**, Texcoco (Mexico)

Filippo Biscarini HerrFalloppio

(Biostatistician, bioinformatician and quantitative geneticist) **CNR-IBBA**, Milan (Italy)

Oscar González-Recio OscarGenomics

(Computational biologist and quantitative geneticist) **INIA-UPM**, Madrid (Spain)

Recap: demystifying the practicals

Illustrations

- local (your computer)
- RStudio
- R Markdown: interactive scripts that mix code and explanations

(more free to experiment/change as you please; beware of local settings and paths to data/scripts)

GWAS workflow

- on the server
- bash/R/stand-alone software (Plink, Beagle)
- self-contained scripts
- Pipeline

(common server settings, more structured workflow; hurdle of working on the server with tools like the Linux shell, vim and git)

The GWAS workflow

1. **Get the data**: phenotypes and genotypes
2. **Filter** the data
3. **Impute missing** SNP genotype data
4. **Build** and **run** the **GWAS model**

GWAS workflow in one slide

step 1 - getting the data

- **1.get_data.sh**
  - Download the data
  - Prepare the data

step 2 - filter the data

- **2.steps_filtering.sh**
  - Filter genotype data:
    - MAF
    - Missing rate

step 3 - imputing missing genotypes

- **3.step_imputation.sh**
  - Impute missing genotype data:
    - LHCI

the stand-alone GWAS scripts

- Run GWAS programmatically
  - gwas_rrblup.R
  - gwas_statgengwas.R
  - gwas_sommer.R

step 4 - run the GWAS

- **4.gwas.sh**
  - Run GWAS through the stand-alone script
  - (try multiple scripts: gwas_rrblup.R, gwas_statgengwas.R, gwas_sommer.R)
